

HIGH PERFORMANCE DTV MONITORING

Equipment for real-time monitoring of DVB-T / DVB-T2 / ISDB-Tb and transmitter RF performance.

Simultaneous monitoring of the ASI input or IP input Transport Stream to the transmitter and the Transport Stream demodulated by the transmitted RF signal.

Analysis of Transport Streams according to international standards.

Real-time analysis of "Black & Freeze" events on individual programs of the Transport Stream flow. Possibility to set event duration interval and percentage of the frame to be analyzed.

BER, MER and Carrier Offset measurements

SFN Network Delay

Graphical representation of Spectrum, Constellation and MER vs Carrier

Graphical representation of PCR Jitter Accuracy and PCR Overall Jitter

Remote viewing and real-time video (of both TS ASI stream and demodulated RF stream) via UDP

Log alarms and measures

Local visualization and settings via front display

Local visualization and settings via Web interface and SNMP

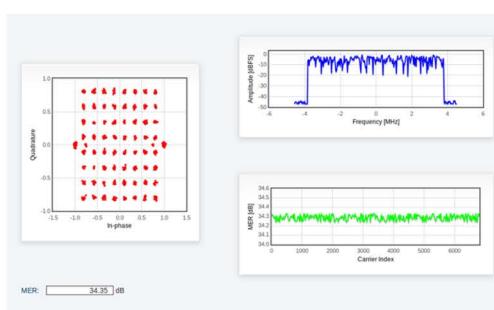

Manual recording of video streams with settable recording time

Automatic recording triggered by specific events

Multi-probe system with HDD for storing recording logs

SFN Check and PPS CrossCheck:
SFN DVB-T transmitters and GPS operativity check

RF Polling: monitoring of multi-channel systems using a single probe. The probe carries out measurements on all channels (up to 16) with a settable polling time
